

An agent controls its own history. Its owner may never see an omitted action.

THE PAPER'S INTENTION

Independent audit of agent actions

Service records the action

Owner recovers a private record

WHAT I IMPLEMENTED IN VITA-FL

An auditable record of the three model-use steps.

Load
model

Select
X-ray

Run
inference

Receiver records each call before returning success.

Scope: receipts are checked inside the agent service; independent owner oversight remains open.

Figuera · Notarized Agents (2026) · arXiv:2606.04193

A prediction alone does not show which model processed which input.

THE DRAFT'S INTENTION

Make one inference checkable by others.

Model + input + result

Linked to execution evidence

WHAT I IMPLEMENTED IN VITA-FL

Connect the published DFL model to its later use by the agent.

Published DFL model

Selected X-ray + prediction

Audit record

Preserve the checked evidence for later review.

Adaptation: integrated with DFL and later auditing; execution trust relies on worker admission.

Tsyrlunikov · AIR Internet-Draft 02 (2026) · work in progress

Agent reports “I loaded the model and ran the inference.”

PAPER'S AIM

The owner can privately audit actions without trusting the agent or its operator.

MY IMPLEMENTATION

The receiver records the three steps.

Model loaded

X-ray selected

Inference run

Receipts are logged before success is returned; the agent checks them.

Scope: receipts are checked inside the agent service; independent owner oversight remains open.

Figuera · Notarized Agents (2026) · arXiv:2606.04193

AIR: give the prediction a traceable origin

Agent reports “Our shared model produced this result.”

DRAFT’S AIM Make one result traceable to its model, input and execution.

MY IMPLEMENTATION

Link the DFL model to its later use.

Published DFL model

This X-ray + this prediction

Later review

The agent checks the linked evidence and preserves it in the transparency log.

Scope: trust in the executing service relies on its prior admission as a worker.
