

From campaign to verified results

EVALUATION · HOW THE TOOLS WORK TOGETHER

One workflow connects experiment planning, measurement and system checks.

Three evaluation layers, one deployed system

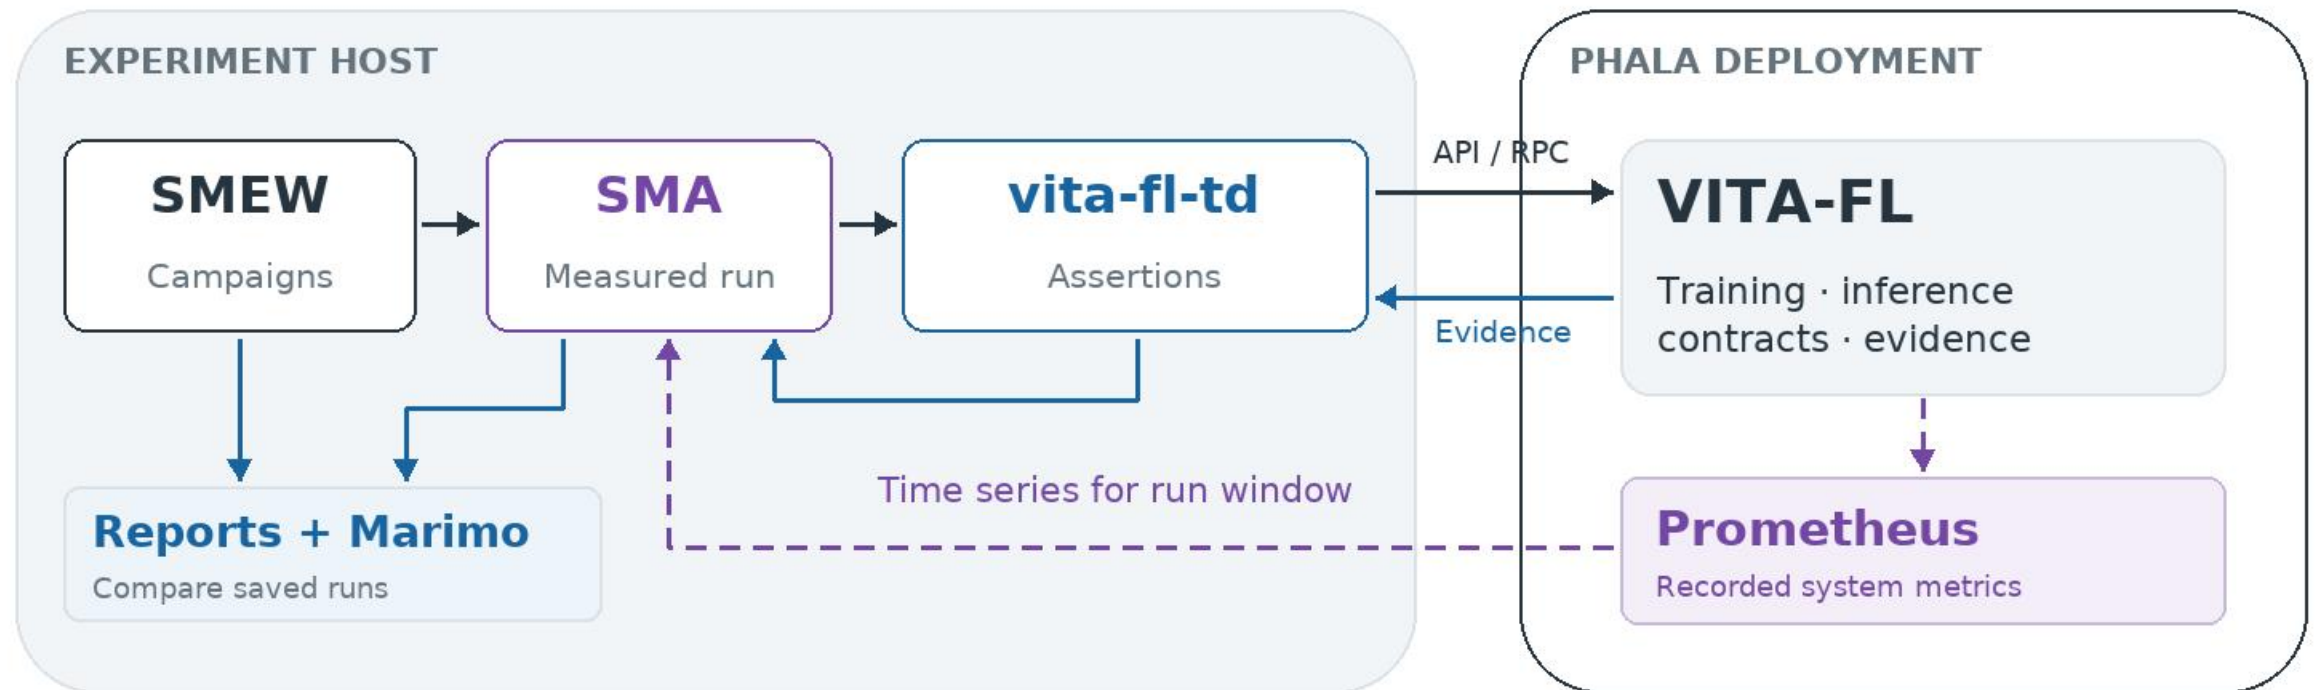

EVALUATION · HOW THE TOOLS WORK TOGETHER

Campaign → measured run → test scenario; VITA-FL is the external system under test.

Each run combines test verdicts, artifacts and measurements for later analysis in Marimo.

The test driver stays outside VITA-FL and checks its observable behavior.

SMA retrieves the time series for its measurement window after the scenario ends.

Four tools, four responsibilities

EVALUATION · HOW THE TOOLS WORK TOGETHER

Each component answers a different question in the evaluation.

COMPONENT	EVALUATION QUESTION	CONTRIBUTION
SMEW	What should run, and how often?	Campaigns & run status
SMA	What happened during the run?	Process & measurement report
vita-fl-td	Did the expected behavior occur?	Assertions & verified evidence
VITA-FL	What does the deployed system do?	Models, events & receipts

Together in Marimo: scenario outcomes + measurements + evidence
